Lab Challenge: Indian Income Tax Calculator (FY 2025-26 - Simplified)

Problem Statement

Develop a Python program to calculate the annual income tax payable by a salaried employee.

The program should:

1. Read Employee Name.
2. Read Annual Income.
3. Read Regime Choice:
    - 1 → New Tax Regime
    - 2 → Old Tax Regime
4. If Old Regime is selected:
    - Read deductions under 80C.
5. Calculate taxable income.
6. Calculate tax based on slabs.
7. Display detailed tax report.

Tax Slabs

New Regime

Income Range	Tax Rate
Up to 4,00,000	0%
4,00,001 – 8,00,000	5%
8,00,001 – 12,00,000	10%
12,00,001 – 16,00,000	15%
Above 16,00,000	20%

Old Regime

Income Range	Tax Rate
Up to 2,50,000	0%
2,50,001 – 5,00,000	5%
5,00,001 – 10,00,000	20%
Above 10,00,000	30%

Additional Requirements

Requirement 1: Input Validation

If income is negative:

```
while income < 0:
    print("Invalid Income")
```

Use a while loop.

Requirement 2: Multiple Employees

Ask:

```
Do you want to calculate another employee? (Y/N)
```

Use a loop.

Requirement 3: Tax Category

Display:

```
No Tax
Low Tax Payer
Medium Tax Payer
High Tax Payer
```

using if-elif ladder.

Sample Output

```
================================
INDIAN TAX CALCULATOR
================================

Employee Name : Alpha
Annual Income : 1200000

Select Regime
1. New Regime
2. Old Regime

Choice : 2

Enter 80C Deduction : 150000
```

Taxable Income : 1050000

Tax Payable : Rs. 127500

Category : Medium Tax Payer
